

DNA Parentage Test No. 21-5870/5 Summary Report

Each participant received a sample pack consisting of four blood samples representing a paternity case. Samples were collected from a mother, a son, and two potential fathers. Participants were requested to analyze the samples using their existing protocols. The test also included a paper kinship exercise where participants were requested to evaluate the provided DNA profiles and determine if a half sibling relationship was supported. Data were returned from 72 participants and are compiled into the following tables:

This report contains the data received from the participants in this test. Since these participants are located in many countries around the world, and it is their option how the samples are to be used (e.g., training exercise, known or blind proficiency testing, research and development of new techniques, etc.), the results compiled in the Summary Report are not intended to be an overview of the quality of work performed in the profession and cannot be interpreted as such. The Summary Comments are included for the benefit of participants to assist with maintaining or enhancing the quality of their results. These comments are not intended to reflect the general state of the art within the profession.

Participant results are reported using a randomly assigned "WebCode". This code maintains participant's anonymity, provides linking of the various report sections, and will change with every report.

Manufacturer's Information

Each sample set was a collection of known blood samples, provided on either FTA Microcards or swabs, from four individuals (Items 1-4); a mother, a son, and two potential fathers. Participants were requested to analyze these items using their existing protocols. Also included with this test was a kinship exercise that consisted of autosomal DNA profiles of two individuals for comparison. Participants were requested to determine if a half sibling relationship claim was supported following the review of these profiles.

SAMPLE PREPARATION: All stains were prepared from human whole blood which was drawn into EDTA tubes. Item 1 was blood from a female (mother) donor, Item 2 was blood from a male (son) donor, Item 3 was blood from a male donor who was the biological father of the Item 2 male, and Item 4 was blood from a male donor who was not the biological father of the Item 2 male. Each FTA card was spotted with 75ul of blood, while each swab (two swabs per item) was spotted with 100uL of blood. The different items were prepared at separate times and were packaged once they were thoroughly dried. Completed sample sets were stored at -20°C until shipment on February 17th, 2021.

SAMPLE SET ASSEMBLY: For each sample set, all four Items (1-4) in their separate envelopes were placed in a pre-labeled sample pack envelope and sealed. The sample pack envelopes were then packaged in pre-labeled Heat Seal envelopes and sealed. This process was repeated until all of the sample sets were prepared.

KINSHIP EXERCISE: This exercise included allelic results representing a half sibling relationship.

VERIFICATION: Laboratories that conducted predistribution analysis of the samples reported consistent results and associations.

Key to Test Substrates

5870 - FTA Microcards

5875 - Swabs

Amelogenin and STR Results

Results compiled from predistribution laboratories and a consensus of at least 10 participants.

* Results were not received from a minimum of 10 participants for the loci and database indicated.

**These ranges are provided to allow participants that utilized databases other than FBI PopStats and NIST STRBASE to review their results. Following AABB guidelines, ranges were determined by taking the grand mean of all data submitted for the associated locus and calculating 3 standard deviations above and below that value.

Summary Comments

The 21-5870/5 DNA Parentage test was designed to allow participants to assess their proficiency in the analysis and interpretation of four known blood samples. Item 1 was blood collected from a female donor (mother), Item 2 was blood collected from a male donor (son of the Item 1 female), Item 3 was blood collected from a male donor who is the biological father of the Item 2 male, and Item 4 was blood collected from a male donor who is not the biological father of the Item 2 male. Participants were requested to analyze the samples and provide allelic and statistical results as well as relationship conclusions. The test also included a paper kinship exercise where participants were requested to evaluate the provided DNA profiles and report the kinship index and relationship conclusions (Refer to the Manufacturer's Information for preparation details).

DNA Analysis:

All 72 participants who returned data reported STR results for all four items. For Item 1, all participants reported consistent data. For Item 2, all participants reported consistent data except for one, who reported "10,11" at Penta D whereas the consensus was "11,11". For Item 3, 18 (25%) participants reported "18" or "18,18" at D3S1358 whereas the consensus was "15,18". It should be noted that many additional comments indicated that there was a possible mutation between the Item 2 (child) and Item 3 (biological father) at D3S1358, as the Item 2 consensus at this locus was "17,17" and the Item 3 consensus at this locus was "15,18". Multiple participants indicated a peak height imbalance between the 15 allele and the 18 allele for Item 3 at D3S1358. For Item 4, all participants reported consistent data except for one, who reported "20,21" at D18S51 whereas the consensus was "20,20".

For YSTR results, the individual profiles for all items were consistent among all but three reporting participants. One participant reported results inconsistent with the consensus at DYS385 and DYS456 for all three items. One participant reported alleles for Item 3 that were inconsistent with consensus but consistent with the consensus for Item 4. One participant reported "15.1" at DYS437 whereas the consensus was "15".

Paternity DNA Statistics:

All 72 participants reported that the source of Item 3 could not be excluded as the biological father of Item 2. Of the participants that reported probability of paternity values, all reported 99.99% or higher. The most frequently reported population database was NIST STRBASE.

Kinship DNA Statistics

There were 31 participants who responded for the paper kinship exercise. For the loci likelihood ratio (LR) data, four participants consistently reported values that did not match consensus, however these four participants reported using Kin CALc software which utilized different allele frequencies than the ones that were provided. Of the 31 participants, 23 (74%) reported a combined Kinship Index (KI) between 30 and 37. Seven participants reported KI values below 20 and the remaining participant reported a percentage of ~97%. Of the 31 participants, 24 reported that the claim of a half sibling relationship was supported. Five participants reported that the relationship was inconclusive, with all five of these participants having combined KI values between 30 and 37. All five of these participants included in their Additional Statistical Results that their lab protocols require more information, such as additional relatives for testing, to make a final conclusion. Two participants reported that the relationship was not supported, one of which stated they would require additional testing before issuing a conclusion.

Additional Kinship Statistical Results

TABLE 8

| WebCode-Test | Additional Statistical Results |
|--------------|---|
| 24KPGQ-5875 | NA indicates that there are no alleles in common between the two alleged half siblings. |
| 4D6FGN-5870 | There is a moderate support to the hypothesis of half sibling relationship versus unrelated' hypothesis. PI calculated by Familias3 = 1.92E+01 (Probability of Paternity 95.05%). |
| 4VKNGN-5875 | As noted in the Comments Section [Table 9], the reported values are Kinship Index (KI) values calculated using KIn CALc 5.0.12 BFS software that uses standard formulae for simple PI's and 2-person KI's that incorporate a theta value of 0.01 with allele probabilities with no rounding and a 1/k prior instead of x/N. Although the software reports the KI at each locus at up to nine significant figures, the final combined KI is reported as two significant figures. Due to possible genetic linkage between the vWA and D12S391 loci, the genotypes from only one of those loci (vWA) were used in the KI calculation. Per our laboratory practice, only the GlobalFiler loci are used for the KI calculations, hence no KI's were reported for Penta D and Penta E loci. |
| 9L32AH-5875 | Based on AABB standards, these results would be accompanied by the narrative: The genetic evidence supports the relationship of Sib 1 and Sib 2 as second degree relatives such as half siblings. Pu and Linacre have shown at a likelihood ratio >33 that STR test results correctly confirm second degree relationships >99% of the time.(Increasing the confidence in half-sibship determination based upon 15 STR loci. Pu and Linacre. Journal of Forensic and Legal Medicine 15 (2008) 373–377.). |
| BHDBZP-5870 | This kinship statistic not calculated at this laboratory. |
| BNEK8H-5870 | The forensic findings (persons C and D DNA profiles) provide moderate support for the half-siblingship rather than the being unrelated. |
| C8ADRF-5875 | The likelihood ratios shown above were calculated using the Kin CALc software that uses standard formulae for simple PI's and 2-person KI's that incorporate a theta value of 0.01 with allele probabilities with no rounding and a 1/k prior instead of x/N. The combined KI (Caucasian) shown above does not include D12. D12 was removed due to genetic linkage with vWA. The Penta D and Penta E loci were not calculated as these loci are not tested in this laboratory. The combined KI (Caucasian) is only calculated to 2 significant figures by the Kin CALc software. |
| G33GBB-5875 | This method of manual calculation of half-sibs is outside the scope of the Laboratory, however it was carried out. For this laboratory, at least two family members are necessary in order to establish a probable more reliable kinship relationship. |
| GPEERH-5870 | There is limited support of a relationship of half siblings supported by the genetic evidence. |
| HNFQND-5870 | When we perform the statistical calculation of half siblings relationship between profile A and profile B, a likelihood ratio of 33.26637 was obtained, that is to say that it is 33 times likely that profile A and profile B are half siblings than they are not. Given the above it is suggested that to provide greater certainty to support the DNA analysis, it is necessary to evaluate more relatives or additional identification like Y chromosome. |
| JE6N3C-5870 | For the previous case: When performing the statistical calculation it was observed that it is 33.2657 times people are more likely to be half-siblings than other randomly selected people, given the genetic profiles analyzed. However, based on the policies of this laboratory, in a case such as this we would request more information on this. However, based on the policies of this laboratory, in a case like this we would request more information on the matter, for example more direct relatives in case they exist or in case they are males we would use another method of amplification such as Y amplification method such as Y FILER PLUS; in order to be able to increase the LR or IP in this case. That the LR or IP is increased because the value obtained for this case is low and very questionable by another Expert. |

TABLE 8

| WebCode-Test | Additional Statistical Results |
|--------------|--|
| M3KHJ7-5875 | vWA excluded from calculations due to possible linkage with D12S391 |
| MM9639-5870 | Although the likelihood ratio values moderately support the relationship of half-sibs, our laboratory suggests a conservative position until incorporating more relatives, as well as the use of other identification systems. For the statistical results we used the Probabilistic Genotyping Software DNAVIEW v. 29.52, also we used the Caucasian population NIST STRBASE Database allele frequencies. |
| N9LCQ7-5870 | It is probable that Sibling C is a half sibling of Sibling D.* Combined half sibship index = 33.283. Probability of half sibship = 97.08% (50% prior probability). **AABB RT Standard 5.3.8.2 states that likelihood ratios greater than 10 shall be considered genetic evidence supporting the tested relationship. 100% of the ratios above this value have been found to be associated with a true second-degree relationship between the tested parties. |
| UZA98Z-5870 | The DNA evidence is approximately 33 times more likely to be observed under the scenario that the profile C is from a biological half sibling of Profile D, rather than from an unrelated individual. Likelihood ratio of 33 provides limited support for the relationship. |
| W8GM32-5870 | The probabilities applied for alleles identical by descent for half siblings are values Z0=0.5, Z1=0.5, Z2=0. Theta value used = 0.02 (included in formula above). |
| WCWUQ2-5870 | AUTOSOMAL STRs: The DNA profile is single source. The kinship index supports the hypothesis that Profile D is the half sibling of Profile C using the reference populations listed. The genotype observed for Profile D is "X" times more likely to occur in a half sibling of Profile C than in someone unrelated to Profile C from the reference populations listed where "X" equals: African American – 460. Caucasian – 21. Hispanic – 55. |
| X6TB3V-5870 | According to the international guidelines suggested by John M. Butler, the kindship index obtained, indicates a moderately strong support for the half-sibling relationship. However, according to the parameters established by our laboratory, in this case, no statement would be issued and additional samples for a complementary comparison (mother and/or father) will be required. |
| XZXG6U-5875 | The likelihood ratios were calculated with the Kin CALc software that uses standard formulae for simple PI's and 2-person KI's that incorporate a theta value of 0.01 with allele probabilities with no rounding and a 1/k prior instead of just x/N. Combined kinship index omits the locus D12S391 due to linkage disequilibrium. ^ Only GlobalFiler loci used in calculation per TL, additional loci (PentaD, PentaE) not tested at our laboratory. |
| YWXR2R-5875 | * The likelihood ratios were calculated with the KinCALc software that uses standard formulae for simple PI's and 2-person KI's that incorporate a theta value of 0.01 with allele probabilities with no rounding and a 1/k instead of just x/N. The KinCALc software uses the NIST STRBase Population Database. Although the likelihood ratios for all loci are shown only one of the vWA/D12S391 loci were used to calculate the combined KI, due to linkage between these two loci. For this example D12S391 was omitted. The scenario did not state if these were paternal or maternal half-sibling so I calculated base on maternal half-sibling. Also we do not test PentaD and PentaE in our laboratory so those loci were not evaluated. |
| ZULEXV-5875 | Additional testing is recommended. |

Additional Comments

TABLE 9

| WebCode-Test | Additional Comments |
|--------------|---|
| 2W4TZW-5870 | No PI statistics were calculated for exclusionary conclusions (item 1.4). |
| 3CUFJT-5870 | For item 3 Alleged Father A, there is an indication of a possible binding site mutation in the D3S1358 locus. There was severe heterozygote allele imbalance, where the observed 15 allele is significantly smaller than the observed 18 allele (8% to 10% ratio between the two peaks). The sample from the Alleged Father A was sampled multiple times, extracted using the phenol/CHCl3 extraction and PrepFiler extraction methods, and typed using both the direct GlobalFiler Express and GlobalFiler amplification systems. The small 15 allele in the D3S1358 locus was observed in three samples amplified using the GlobalFiler system. The 15 allele was not observed in the one sample amplified using the GlobalFiler Express direct amplification system. The GlobalFiler Express direct system is used to amplify only DNA reference samples and has a higher analytical threshold. CPI was calculated using vWA, but not D12S391, to account for the possibility that these loci could be in linkage disequilibrium for paternity samples. |
| 3FTRFT-5870 | CPI was calculated using D12S391, but not vWA, to account for the possibility that these loci could be in linkage disequilibrium for paternity samples. |
| 3Y9ZGU-5870 | Item 001.A.01.a.01: Biological stain cutting of FTA card described as coming from Victim, Victim; DNA Number D7514. AUTOSOMAL STRs: The DNA profile is single source. Item 001.A.02.a.01: Biological stain cutting of FTA card described as coming from Victim, Child; DNA Number D7515. AUTOSOMAL STRs: The DNA profile is single source. Item 001.A.03.a.01: Biological stain cutting of FTA card described as coming from Subject, Subject 1; DNA Number D7516. AUTOSOMAL STRs: The DNA profile is single source. The alleged father, Subject 1 Subject, cannot be excluded as the potential biological father of the child, Child Victim using Autosomal STRs. These profiles are "X" times more likely to occur if Child Victim is the child of Victim Victim and Subject 1 Subject than if Child Victim is the child of Victim Victim and a random person from the reference populations listed where "X" equals: African American – 1.0 Billion. Caucasian – 17 Million. Hispanic – 320 Million. Item 001.A.04.a.01: Biological stain cutting of FTA card described as coming from Subject, Subject 2; DNA Number D7517. AUTOSOMAL STRs: The DNA profile is single source. The alleged father, Subject 2 Subject, is excluded as the potential biological father of the child, Child Victim using Autosomal STRs. Item 001.B: Profile C, AUTOSOMAL STRs: The DNA profile is single source. The kinship index supports the hypothesis that Profile D is the half sibling of Profile C using the reference populations listed. The genotype observed for Profile D is "X" times more likely to occur in a half sibling of Profile C than in someone unrelated to Profile C from the reference populations listed where "X" equals: African American – 320. Caucasian – 25. Hispanic – 64. Item 001.C: Profile D, AUTOSOMAL STRs: The DNA profile is single source. |
| 4VKNGN-5875 | For Item 3, a reproducible peak height imbalance of ~10% was observed between the 15-allele and 18-allele peaks at the D3S1358 locus. The 15-allele is possibly a partial null allele due to a mutation at a primer binding site. For Part I PI values [Table 2], Part II Combined PI value [Table 5], and Part III Kinship DNA Statistics [Tables 6-8], the reported values are Kinship Index (KI) values calculated using KIn CALc 5.0.12 BFS software that uses standard formulae for simple PI's and 2-person KI's that incorporate a theta value of 0.01 with allele probabilities with no rounding and a 1/k prior instead of x/N. Although the software reports the KI at each locus at up to nine significant figures, the final combined KI is reported as two significant figures. Due to possible genetic linkage between the vWA and D12S391 loci, the genotypes from only one of those loci were used in the KI calculation. For Item 3, a mutation was allowed for the calculation of the KI at the D3S1358 locus. For Part II [Table 5], no value was listed for the Probability of Paternity since our laboratory does not report Probabilities of Paternity. For Part III: Kinship DNA Statistics [Tables 6-8]; since the reported Likelihood Ratios are KI values calculated using the KIn CALc 5.0.12 BFS software as mentioned above, the "Formula Used" and "Allele Legend" for each locus were not available to report. The CTS-provided Allele Frequencies for each locus were not used by the KIn CALc software. Per our laboratory practice, only the GlobalFiler loci are used for the KI calculations, hence no KI's were reported for Penta D and Penta E loci. The genotypes at the D12S391 locus were not used, due to possible genetic linkage with the vWA locus. |

TABLE 9

| WebCode- Test | Additional Comments |
|------------------|--|
| 68DRYM- 5870 | 1) On comparison to the DNA profiles obtained, I found that the source of bloodstain specimen "Item 3" is the biological father to the source of bloodstain specimen "Item 2" (given that the biological mother is represented by the source of bloodstain specimen "Item 1"). 2) On comparison to the DNA profiles obtained, I found that the source of bloodstain specimen "Item 4" is not the biological father to the source of bloodstain specimen "Item 2" (given that the biological mother is represented by the source of bloodstain specimen "Item 1"). 3) Extraction: Item 1, Item 2, Item 3 and Item 4 were extracted using in-situ method. 4) Amplification: Item 1, Item 2, Item 3 and Item 4 were amplified using Globalfiler Express (GFE) on PROFLEX PCR System. Item 2, Item 3 and Item 4 were further amplified using AmpFISTR Y-Filer PCR Amplification kit on 9700 GeneAmp PCR System. 5) Electrophoresis: Electrophoresis were carried out on Genetic Analyzer 3500xl for Item 1, Item 2, Item 3 and Item 4 (Globalfiler Express). Electrophoresis were carried out on Genetic Analyzer 3500xl for Item 2, Item 3 and Item 4 (Yfiler). 6) Quality Control: Reagent blank, positive control and negative control were incorporated in the overall analysis and gave designated results. 7) The statistical formula were derived from DNAView Statistical Software and calculated using Microsoft Excel. |
| 6HV9QU- 5870 | For part I [Tables 1, 2, & 4], Item 3: Results are entered only for GlobalFiler loci as casework reporting is on GlobalFiler loci. PowerPlex Fusion 6C is used only for allele verification. Average mutation paternity index calculated for locus D3S1358. The locus D12S391 is not used for paternity index calculations in our laboratory. For part I [Tables 1, 2, & 4], Item 4: Based on laboratory SOP, when there are three or more genetic inconsistencies, we will exclude the alleged parent as a possible biological parent of the child. We do not calculate paternity index for individual locus if alleged father is excluded. For part III [Tables 6-8: Kinship Exercise]: Our laboratory does not perform half-sibling relationship testing. |
| 8VUWWT- 5870 | D12S391 is omitted from all final calculations, as per laboratory policy. The overall CPI without the mutation locus, the PI for the mutation locus, and the final CPI are each truncated to 2 significant figures, as per laboratory policy. |
| 9CXQ3T- 5870 | * Per agency policy, D12S391 not used for PI calculations due to linkage with vWA. * Per case information and agency policy, Caucasian PI values are reported here. |
| 9UW73J- 5870 | 1. On comparison to the DNA profiles obtained, I found that the source of bloodstain specimen "Item 3" is the biological father to the source of bloodstain specimen "Item 2" (given that the biological mother is represented by the source of bloodstain specimen "Item 1"). 2. On comparison to the DNA profiles obtained, I found that the source of bloodstain specimen "Item 4" is NOT the biological father to the source of bloodstain specimen "Item 2" (given that the biological mother is represented by the source of bloodstain specimen "Item 1"). 3. Item 1, Item 2, Item 3 and Item 4 were extracted using in-situ method. 4. Amplification: Item 1, Item 2, Item 3 and Item 4 were amplified using Globalfiler Express (GFE) on PROFLEX PCR System. Item 2, Item 3 and Item 4 were further amplified using AmpFISTR Y-Filer PCR Amplification kit on 9700 GeneAmp PCR System. 5. Electrophoresis: Electrophoresis was carried out on Genetic Analyzer 3500xl for Item 1, Item 2, Item 3 and Item 4 (Globalfiler Express). Electrophoresis was carried out on Genetic Analyzer 3500xl for Item 2, Item 3 and Item 4 (Yfiler). 6. Quality Control: Reagent blank, positive control and negative control were incorporated in the overall analysis and gave designated results. 7. The statistical formula was derived from DNAView Statistical Software and calculated using Microsoft Excel. |

TABLE 9

| WebCode- Test | Additional Comments |
|------------------|---|
| AVJ6UM- 5870 | <p>Item 001.A.01.a: Biological stain cutting of FTA card labeled as Test No. 21-5870, Item 1, Victim, Victim; DNA Number D7551. AUTOSOMAL STRs: The DNA profile is single source. Item 001.A.02.a: Biological stain cutting of FTA card labeled as Test No. 21-5870, Item 2, Victim, Child; DNA Number D7552. AUTOSOMAL STRs: The DNA profile is single source. Item 001.A.03.a: Biological stain cutting of FTA card labeled as Test No. 21-5870, Item 3, Subject, Subject A; DNA Number D7553.</p> <p>AUTOSOMAL STRs: The DNA profile is single source. The alleged father, Subject A Subject, cannot be excluded as the potential biological father of the child, Child Victim using Autosomal STRs. These profiles are "X" times more likely to occur if Child Victim is the child of Victim Victim and Subject A Subject than if Child Victim is the child of Victim Victim and a random person from the reference populations listed where "X" equals: African American – 1.0 Billion. Caucasian – 17 Million. Hispanic – 320 Million. Item 001.A.04.a: Biological stain cutting of FTA card labeled as Test No. 21-5870, Item 4, Subject, Subject B; DNA Number D7554. AUTOSOMAL STRs: The DNA profile is single source. The alleged father, Subject B Subject, is excluded as the potential biological father of the child, Child Victim using Autosomal STRs.</p> <p>Item 002: Profile C. AUTOSOMAL STRs: The DNA profile is single source. Item 003: Profile D.</p> <p>AUTOSOMAL STRs: The DNA profile is single source. The kinship index supports the hypothesis that Profile D is the half sibling of Profile C using the reference populations listed. The genotype observed for Profile D is "X" times more likely to occur in a half sibling of Profile C than in someone unrelated to Profile C from the reference populations listed where "X" equals: African American – 460. Caucasian – 21. Hispanic – 55.</p> |
| BHDBZP- 5870 | Per laboratory policy, D12S391 genetic locus not used for statistical analysis and CPI value truncated to 2 significant figures. |
| BNEK8H- 5870 | PI calculation was not performed when ITEM 4- AFB was compared to the ITEM 2 - Son, since 13 loci (12 autosomal + DYS391) resulted inconsistent with the paternity proposition; these inconsistencies categorically excluded the paternity of ITEM 4 - AFB on ITEM 2 – Son without any need of PI calculation. The paternity of ITEM3 - AFA on ITEM 2 - Son was proved with a PI=4.4e+6; a likely mutation at locus D3S1358 is conceivable. |
| C8ADRF- 5875 | For the paternity statistics, the likelihood ratios entered were calculated using the Kin CALc software that uses standard formulae for simple PI's and 2-person KI's that incorporate a theta value of 0.01 with allele probabilities with no rounding and a 1/k prior instead of x/N. The combined PI (Caucasian) shown does not include D12. D12 was removed due to genetic linkage with vWA. This laboratory does not report probability of paternity and so this value was not calculated. |
| CP74LN- 5875 | Based on the reference profiles obtained, no conclusion can be made by this laboratory regarding the likelihood of Alleged Father A being the biological father of the Child. The submitter is advised to consult an accredited parentage testing laboratory for further analysis. |
| CT7EHN- 5875 | Due to a possible mutation at D3S1358, I would report as follows: Based on the reference profiles obtained, no conclusion can be made by this laboratory regarding the likelihood of (Alleged Father A) being the biological father of (Known Child). The submitter is advised to consult an accredited parentage testing laboratory for further analysis. |
| EELBBJ- 5870 | PI calculations for Alleged Father B were not calculated as per [Laboratory] policy to exclude on the basis of a mismatch of alleles at 3 or more loci. Probability of Paternity is not calculated by [Laboratory]. For Globalfiler analysis the Combined Paternity Index value has been divided by 4 to take into account the linkage of D12S391 and vWA loci. Theta value used = 0.01. Alleged Father A exhibits a possible primer binding site mutation at D3 resulting in an extreme imbalance between alleles 15 and 18. The DNA profile of the child at D3 indicates a true homozygous 17,17 when compared to other loci in the child's profile. We consider it unlikely enough that Alleged Father A's allele 15 (D3) has mutated to restore peak balance AND also mutated from a 15 to a 17, that only a possible mutation of Alleged Father A's 18 to 17 at D3 was considered in CPI calculations. Calculation of the PI at D3 incorporated the following as per [Laboratory] policy and referenced by the American Association of Blood Banks (AABB) Annual Report Summary for testing in 2008. Apparent mutation rate of D3 in males (0.001691). Apparent mutation rate of D3 in males by change in repeat length (-1 change = 0.4464). |

TABLE 9

| WebCode-Test | Additional Comments |
|--------------|--|
| EXAWTL-5870 | Item #3 D12S391 not used for stats. Caucasian PI based on information given and laboratory policy. |
| F3KABK-5870 | Combined Paternity Index value truncated to 2 significant figures per lab protocol. D12S391, DYS391, and Amelogenin loci are not used for statistical purposes per lab protocol. Kinship DNA Statistics section is not applicable. |
| FJ8NPC-5870 | 1) On comparison to the DNA profiles obtained, I found that the source of stained-blood specimen "Item 3" is the biological father to the source of stained-blood specimen "Item 2" (given that the biological mother is represented by the source of stained-blood specimen "Item 1"). 2) On comparison to the DNA profiles obtained, I found that the source of stained-blood specimen "Item 4" is not the biological father to the source of stained-blood specimen "Item 2" (given that the biological mother is represented by the source of stained-blood specimen "Item 1"). 3) Extraction: Item 1, Item 2, Item 3 and Item 4 were extracted using in-situ method. 4) Amplification: Item 1, Item 2, Item 3 and Item 4 amplified using GlobalFiler Express PCR Amplification Kit on ABI ProFlex PCR System. Item 2, Item 3 and Item 4 were further using AmpFLSTR Y-Filer PCR Amplification Kit on ABI GeneAmp PCR System 9700. 5) Electrophoresis: Electrophoresis was carried out on Genetic Analyzer 3500xL for Item 1, Item 2, Item 3 and Item 4 (GlobalFiler Express). Electrophoresis was also carried out on Genetic Analyzer 3500xl for Item 2, Item 3 and Item 4(Y-Filer). 6) Quality Control: Reagent blank, Positive Control and Negative Control were carried out through analysis and all gave intended results. 7) The statistical formula were derived from DNAView Statistical Software and calculated using Microsoft Excel. |
| FZWYCE-5870 | NR = No Results. A possible mutation exists between Known Child (Item 2) and Alleged Father A (Item 3) at locus D3. This laboratory does not exclude parent/offspring kinship based on a single inconsistency. Y-STR analysis confirms biological relationship between Known Child (Item 2) and Alleged Father A (Item 3). |
| G33GBB-5875 | A difference was observed in marker D3S1358. The mother has alleles 17,18 and the supposed father A, presents alleles 15,18, while the son shows only a peak of 17 repetitions in size in that marker. Possible causes of the above can be a mutation due to a deletion, a mutation in the primer binding site in the paternal allele that would cause a null allele, or a uniparental disomy, among others. Determining what type of mutation is beyond the capabilities of this laboratory. In any case, CODIS performed the paternity calculation considering a possible mutation. |
| GUA9PJ-5870 | This laboratory does not report half-sibling relationship statistics as asked in Part III [Tables 6-8: Kinship Exercise]. Laboratory policies for rounding/truncating for manual calculation to incorporate mutation at D3S1358 were followed. |
| HCY76G-5870 | 1) On comparison to the DNA profiles obtained, I found that the source of bloodstain specimen "Item 3" is the biological father to the source of bloodstain specimen "Item 2" (given that the biological mother is represented by the source of bloodstain specimen "Item 1"). 2) On comparison to the DNA profiles obtained, I found that the source of bloodstain specimen "Item 4" is not the biological father to the source of bloodstain specimen "Item 2" (given that the biological mother is represented by the source of bloodstain specimen "Item 1"). 3) Extraction: Item 1, Item 2, Item 3 and Item 4 were extracted using in-situ method. 4) Amplification: Item 1, Item 2, Item 3 and Item 4 were amplified using GlobalFiler Express PCR Amplification Kit on ABI Proflex PCR System. Item 2, Item 3 and Item 4 were further amplified using AmpFLSTR Y-Filer PCR Amplification Kit on ABI GeneAmp PCR System 9700. 5) Electrophoresis: Electrophoresis was carried out using Genetic Analyzer 3500xL for Item 1, Item 2, Item 3 and Item 4 (Globalfiler Express). Electrophoresis was carried out using Genetic Analyzer 3500xL for Item 2, Item 3 and Item 4 (Yfiler). 6) Quality Control: Reagent Blank, Positive Control and Negative Control were incorporated in the overall analysis and gave designated results. 7) The statistical formula were derived from DNAView Statistical Software and calculated using Microsoft Excel. |
| JXWWZ8-5870 | Locus d3s1358 analysis revealed a potential mutation as Item2 and Item3 do not match, i.e. Item 2 Alleles =17,1 vs Item 3 Alleles: 18.18, even when typed with different kits (data not reported in data sheet boxes). Thus a 0,1 mutation rate was included into the Familias statistic calculation. |

TABLE 9

| WebCode-Test | Additional Comments |
|--------------|---|
| LGMPYB-5870 | Paternity probability is not calculated at my laboratory. I am not authorised in Kinship analysis. Allele frequencies for local Caucasian database used with a theta value of 0.02. |
| M3KHJ7-5875 | The possibility of a mutation for Item 2 at D3S1358 was included in the calculations. |
| MM9639-5870 | Regarding the calculations of Paternity Index on item 3, locus D21S11; the Probabilistic Genotyping Software DNAVIEW v. 29.52 didn't use the frequency for the allele 32 reported on the NIST DataBase. Instead of that, DNAVIEW software calculates the Minor Allele Frequency (5/2N); this happens when the number of observations are below to 5. For the Paternity Index calculation in locus D3S1358, we detected a one step mutation, so a mutation rate obtained from AABB DATA website from NIST STR BASE SRD-130 was included. In addition to the autosomal calculations, we used the YHRD Website Kinship Calculation tool and we obtained an LR of 8.2725e+04. |
| MPWG2D-5870 | D12S391 is omitted from the CPI calculation, per laboratory policy. A paternal mutation is assumed at D3S1358. One population database was chosen for all statistical calculations in this test, per CTS instructions. Y-STR statistics were not reported. Our laboratory does not calculate a likelihood ratio for half-sibling relationships or for exclusions. |
| N9LCQ7-5870 | A single inconsistency was noted at D3S1358 in Alleged Father A's parentage analysis. Brenner's method was used to calculate the Mutation Index. The mutation rate for this locus was extracted from the AABB 2008 Annual Report Summary. The reported mutation index is: 0.0022. For comparison, the mutation index using the u/PPE formulae is: 0.0032 and 0.0031 using i)the AABB 2008 mutation rate and FBI/NIST PPE and ii)Ge et (2012) mutation rate and average PPE, respectively. All three methods are valid for use in Relationship Testing and produced mutation indexes in the same order of magnitude and same outcome (i.e. paternal inclusion, high probability of paternity). |
| PRCME7-5870 | In the child's genotype (object Test No. 21-5870, point 2) D3S1358 there is no allele number 18, which are inherent in the genotype of the alleged father (object Test No. 21-5870, point 3). Such a difference from the paternal genotype at one locus is not a basis that categorically excludes the possibility of biological paternity. This is due to a mutational change in the inheritance of paternal alleles. The manufacturer of the test kits also identified mutational changes in the inheritance of paternal alleles. |
| QXUF3B-5870 | Paternity indices, combined paternity index and probability of paternity were reported using the Caucasian population values based on ethnicity information provided in the test scenario. Genetic locus D12S391 was not used for paternity index calculations per laboratory's standard operating procedures. Paternity index calculations were not performed using item 4 due to exclusion as biological father. Item 4: elevated n-4 stutter @15.85% was observed at Fusion locus D12S391 (up to 15.8% n-4 stutter allowed at D12S391 per laboratory's standard operating procedures). |
| V9XG6W-5875 | PHR noted for Item 3 - Severe imbalance ~12.5%. Locus will be reported as 15,18. Mutation rates were applied to paternity statistic at D3 to account for possible mutation. |
| VAQCR6-5870 | Caucasian PI based on information given and laboratory policy. |

TABLE 9

| WebCode-Test | Additional Comments |
|--------------|--|
| VG9HQX-5870 | Amplification: Item 1, Item 2, Item 3 and Item 4 were amplified using AmpFLSTR Identifiler Direct PCR Amplification Kit on Applied Biosystems GeneAmp PCR System 9700. With in-situ method, Item 2, Item 3 and Item 4 were also amplified using AmpFLSTR Yfiler PCR Amplification Kit on Applied Biosystems GeneAmp PCR System 9700. Electrophoresis: Electrophoresis was carried out on Applied Biosystems 3500XL Genetic Analyzer and the data were analyzed with GeneMapper ID-X v1.5 software. Quality control: Reagent Blank, Positive Control and Negative Control were included throughout the analysis and all gave intended results. Statistical Evaluation: The statistical formulas were derived from DNAView Statistical Software and the paternity/kinship index was calculated using Microsoft Office Excel. On comparison of the DNA profiles obtained, I found the following: a) The donor of bloodstained specimen "Item 3" to be the biological father to the donor of bloodstained specimen "Item 2". b) The donor of bloodstained specimen "Item 4" is excluded from being the biological father to the donor of bloodstained specimen "Item 2". (Given that the biological mother is represented by the donor of bloodstained specimen "Item 1"). |
| VHJKCW-5870 | PowerPlex Fusion and YFiler was performed on Item 2, Item 3, and Item 4. Results at the DYS391 locus were concordant between these kits for each sample. "NR" = "No Results". A possible mutation was observed for the child (Item 2) at locus D3S1358 in the PowerPlex Fusion kit, as the child did not share an allele with the alleged father (Item 3). The paternity index calculation for this locus incorporated a documented paternal mutation rate to account for this possible mutation. |
| VLJV9V-5870 | NR = No Result. Item 2 was processed in PowerPlex Fusion and YFiler. The data are consistent at DYS391. Item 3 was processed in PowerPlex Fusion and YFiler. The data are consistent at DYS391. Item 4 was processed in PowerPlex Fusion and YFiler. The data are consistent at DYS391. A possible mutational event occurred at D3S1358 in Item 2. The paternity index at this locus was hand-calculated by incorporating the mutation rate and mean power of exclusion. The combined paternity index value and probability of paternity were hand-calculated to incorporate the value calculated for D3S1358. |
| VZL6C6-5870 | D12S391 is omitted from calculations, as per laboratory policy. The CPI is truncated to 2 significant figures, as per laboratory policy. Mutation rate frequencies are carried out to the number of digits in the actual mutation rate, as per laboratory policy. PI values reported as provided from calculations using the NIST 1036 U.S. Population Dataset. |
| W8GM32-5870 | As per laboratory protocol, CPI calculated for three population groups [Nationality] Caucasian, [Nationality] Aboriginal and [Nationality] Asian with theta values of 0.02, 0.05 and 0.03 applied respectively. The most conservative PI values and resulting CPI reported to two significant figures. |
| WN6WP4-5870 | Caucasian population group utilized. Paternal mutation rate of 0.0013 from the STRbase website and mean power of exclusion of 0.589 from Budowle paper used for D3 calculation (as per SOPs). Locus D12S391 not used for calculations due to possible linkage with vWA (as per SOPs). |
| WTL6D4-5870 | For Alleged Father A, there was a possible mutation at D3S1358 (17 to 18). The PI was calculated by the mutation rate divided by the mean power of exclusion, using a mutation rate value of 0.0012 and a mean power of exclusion value of 0.53877. |
| X6TB3V-5870 | During the genetic analysis carried out in the blood sample of the supposed father A (item 3) in the marker D3S1358, the presence of a null allele was observed, which was confirmed through complementary amplification with the Fusion 6C and 16 HS kits. Additional genetic markers were analyzed because a mutation was found in the genetic marker D3S1358, between CHILD and ASSUMED FATHER A, which was taken into account for the statistical calculation. |
| XAPYJ3-5870 | Due to possible linkage issues with D12 and vWA, vWA was left out of the combined PI calculation. Our lab does not calculate probability of paternity. |
| XZXG6U-5875 | Part II [Table 5: Paternity DNA Statistics & Conclusions] - Combined paternity index calculations considers possible mutations and omits the locus D12S391 due to linkage disequilibrium. Our laboratory does not calculate probability of paternity. |

TABLE 9

| WebCode- Test | Additional Comments |
|------------------|--|
| YNEL3Z- 5870 | A possible mutation was observed at locus D3S1358 in the child's known DNA sample (Item 2). The [Laboratory] procedure is to outsource the paternity statistical calculations to a private laboratory when a possible mutation is present and the alleged father cannot be excluded at the remaining loci from being the biological father of the child. Therefore, the laboratory is not reporting the statistical calculations for this paternity test. |
| YWXR2R- 5875 | Part II - Paternity DNA Statistics [Tables 2 & 5]: The paternity indexes were calculated with the KinCALc software that uses standard formulae for simple PI's that incorporate a theta value of 0.01 with allele probabilities with no rounding and a 1/k instead of just x/N. The KinCALc software uses the NIST STRBase Population Database. Although the paternity index for all loci are shown only one of vWA/D12S391 loci were used to calculate the combined PI, due to linkage between these two loci. For this example D12S391 was omitted. Additionally, a mutation was required at D3S1358. We also report for 3 ethnic groups; African Americans, Caucasians, and Hispanics. For this case only the values for Caucasians were reported since the individuals were reported to be Caucasian. Our laboratory does not report the Probability of Paternity. |
| ZYG76T- 5870 | Any labeled peaks seen in samples that are likely due to PCR/STR artifacts were not reported and will not be used for conclusions or comparisons. DYS391 is reported as INC for the PowerPlex® Fusion System as per laboratory policy. |

-End of Report-
(Appendix may follow)

Collaborative Testing Services ~ Forensic Testing Program

Test No. 21-5870: DNA Parentage

DATA MUST BE SUBMITTED BY April 19, 2021, 11:59 p.m. TO BE INCLUDED IN THE REPORT

Participant Code: U1234A

WebCode: P6ZU8Z

The Accreditation Release section can be accessed by using the "Continue to Final Submission" button above. This information can be entered at any time prior to submitting to CTS.

Scenario:

A paternity case has been presented to your laboratory. Blood standards have been collected from the mother, son, and two alleged fathers. Your laboratory is tasked with examining the blood standards and comparing the DNA profiles.

Items Submitted (Sample Pack DPF1 - FTA Microcards):

- Item 1: Blood Sample from Known Parent (Caucasian Mother)
- Item 2: Blood Sample from Known Child (Son)
- Item 3: Blood Sample from Alleged Father A (Caucasian)
- Item 4: Blood Sample from Alleged Father B (Caucasian)

DNA REPORTING INSTRUCTIONS

Use the instructions below to complete the following DNA Analysis sections of this data sheet

- Report alleles in numerical order, separated by a comma.
- Follow your laboratory procedures for reporting homozygotes (i.e. "14,14", "14,-", "14") and null responses
- PI = Paternity Index
- If your laboratory does not produce PI calculations, record your explanation within the Part IV: Additional comments section.

| Example | D1S1656 | D2S1338 | D2S441 | D3S1358 | D5S818 |
|---------|---------|---------|--------|---------|--------|
| STR | 15,18 | 12,17 | 10 | 14 | 5,13 |
| PI | 1.65 | 3.01 | 3.16 | 4.12 | 5.65 |

Alleles below are sorted in Default order.

Part I (continued): DNA Analysis - Additional DNA

- Use this section to report results for loci not currently listed in other sections of the data sheet.
- Report alleles in numerical order, separated by a comma.
- Click "Add Row" to show another row of boxes for entry.

| Locus | Item 1 | Item 2 | Item 3 Alleles | Item 3 PI | Item 4 Alleles | Item 4 PI |
|-------|--------|--------|----------------|-----------|----------------|-----------|
| | | | | | | |
| | | | | | | |
| | | | | | | |
| | | | | | | |

Part II: PATERNITY DNA STATISTICS

Select which of the alleged fathers below cannot be excluded as the biological parent of the child (Item 2) and answer the remaining questions based on your selection.

Item 3 - Alleged Father A

Item 4 - Alleged Father B

For the selected alleged parent, please utilize your own lab protocols regarding ethnicity and choose one of the following population databases for all statistical calculations in this test:

1. **FBI Popstats:** If FBI Popstats is already available in your laboratory then you may select that option, otherwise use the population database below.
2. **NIST-STRBASE** is a publicly available U.S. population dataset at STRBASE on the following NIST web site:
<http://www.cstl.nist.gov/strbase/NISTpop.htm#Autosomal>
 - a. On the NIST web site, access the population database by selecting the hyperlink labeled "Allele frequencies from autosomal STRs as Excel file" under the title "NIST 1036 U.S. Population Dataset".
3. If you are unable to use one of the suggested population databases, report the population database used in the blank provided next to the 'Other Pop. Database' option. Due to the tendency for allele frequencies to vary amongst different databases, no consensus value will be determined for this option. When reporting a population database name, please refrain from using terms that would allude to a laboratory specific name or location; general terms such as 'local/state database' or 'laboratory specific database' are preferred.
4. If you did not calculate paternity statistics, please provide an explanation in your additional comments.

1. Choose a Population Database:

FBI Popstats Pop. Database:

NIST STRBASE Pop. Database:

Other Pop. Database:

2. Record the Combined Paternity Index value:

3. Record the Probability of Paternity:

Part III: KINSHIP DNA STATISTICS

Complete the following Kinship DNA Statistics section, if applicable to your laboratory, using the instructions below.

- Use the provided scenario for context.
- Use the supplied allele frequencies for calculations (adopted from the NIST STRBASE database).
- Only test the relationship in question (eg. half siblings versus unrelated).
- Complete the entire table including the formula used in the calculation and the allele legend.
- Report a minimum of four significant figures in your likelihood ratio values.

Example: Questioned Half Sibling Relationship

| Locus | Profile A | Profile B | Allele Frequencies | | Formula Used | Allele Legend | Likelihood Ratio |
|-------|-----------|-----------|--------------------|------------|-------------------|----------------------|------------------|
| FGA | 18, 26 | 18, 26 | 18: 0.0249 | 26: 0.0263 | $(p+q+4pq) / 8pq$ | $p = 18$ $q = 26$ | 10.27 |
| | | | | | | | |
| vWA | 14, 15 | 14, 17 | 14: 0.0928 | 15: 0.1053 | $(1+4p)/8p$ | $p = 14$ | 1.847 |
| | | | 17: 0.1053 | | | | |

Scenario:

The two DNA profiles below are presented as a potential Caucasian half sibling relationship. Using the allele frequencies shown for the tested loci, calculate the likelihood ratio for support of the proposed relationship versus being unrelated.

| Locus | C | D | Allele Frequencies | | Formula Used | Allele Legend | Likelihood Ratio |
|---------|-------|-------|--------------------|------------|--------------|---------------|------------------|
| D1S1656 | 11,15 | 14,17 | 11: 0.0776 | 14: 0.0789 | | | |

Part IV: ADDITIONAL COMMENTS

Comments regarding any part of this Test.

Please note: Any additional formatting applied in the free form space below will not transfer to the Summary Report and may cause your information to be illegible. This includes additional spacing and returns that present your responses in lists and tabular formats.

RELEASE OF DATA TO ACCREDITATION BODIES

The Accreditation Release is accessed by pressing the "Continue to Final Submission" button online and can be completed at any time prior to submission to CTS.

CTS submits external proficiency test data directly to ASCLD/LAB, ANAB, and/or A2LA. Please select one of the following statements to ensure your data is handled appropriately.

- This participant's data is intended for submission to ASCLD/LAB, ANAB, and/or A2LA. (Accreditation Release section below must be completed.)
 This participant's data is **not** intended for submission to ASCLD/LAB, ANAB, and/or A2LA.

Have the laboratory's designated individual complete the following steps
only if your laboratory is accredited in this testing/calibration discipline
by one or more of the following Accreditation Bodies.

Step 1: Provide the applicable Accreditation Certificate Number(s) for your laboratory.

ANAB Certificate No.
(Include ASCLD/LAB Certificate here)

A2LA Certificate No.

Step 2: Complete the Laboratory Identifying Information in its entirety.

Authorized Contact Person and Title

Laboratory Name

Location (City/State)
