This report contains the data received from the participants in this test. Since these participants are located in many countries around the world, and it is their option how the samples are to be used (e.g., training exercise, known or blind proficiency testing, research and development of new techniques, etc.), the results compiled in the Summary Report are not intended to be an overview of the quality of work performed in the profession and cannot be interpreted as such. The Summary Comments are included for the benefit of participants to assist with maintaining or enhancing the quality of their results. These comments are not intended to reflect the general state of the art within the profession.

Participant results are reported using a randomly assigned "WebCode". This code maintains participant's anonymity, provides linking of the various report sections, and will change with every report.

## **Manufacturer's Information**

Each sample pack consisted of two known bloodstains on FTA Micro cards (Items 1 & 2), and two questioned stains; one on clean, yellow fabric (Item 3) and one on clean, blue fabric (Item 4). Participants were requested to analyze these items using their existing protocols.

**SAMPLE PREPARATION:** The stains on Items 1, 2, 3, and 4 were prepared using human whole blood which was either drawn into citric acid preservative bags or EDTA tubes. Items 1 (75 µl) and 4 (50 µl) were created using blood collected from the same female donor. Item 2 (75 µl) was created using blood collected from a male donor. Item 3 (50 µl) was created using a 1:1 mixture of blood from the female donor found in Item 1 and blood from a male donor whose known standard was not provided. Stains from different sources were prepared at separate times and were packaged once they were thoroughly dried. Completed sample sets were stored at -20°C until shipment on April 22, 2020 following completion of the verification stage.

**SAMPLE SET ASSEMBLY:** For each sample set, all four items (1-4) were packaged into separate envelopes and then placed together in a pre-labeled sample pack envelope. The sealed sample pack envelopes were then packaged in pre-labeled heat seal envelopes and sealed. This process was repeated until all of the sample sets were prepared.

**VERIFICATION:** All predistribution laboratories confirmed the manufacturer's expected associations. Consistent allelic results were reported for all STR and YSTR loci.

## Summary Comments

The 20-5703 Forensic Biology test was designed to allow participants to assess their proficiency in the identification and comparison of dried stains by means of body fluid screening and/or DNA profiling. Participants were supplied with two "known" bloodstains (Items 1 and 2) and two "questioned" stains (Items 3 and 4). Items 1 and 4 were created using blood from the same female donor. Item 2 was created using blood from a male donor. Item 3 was created using a mixture of blood from the Item 1 female donor and blood from a male donor whose known standard was not provided. (See Manufacturer's Information for preparation details)

Data were returned by 345 participants.

### Screening Test Results:

Screening results were returned by a total of 337 participants. However, not all of these participants returned screening results for all fluids (blood, semen, saliva) for both questioned items, which explains the large differences in the tallies discussed below.

For Item 3, all 327 participants that returned results reported "Positive" for the presence of blood. For the presence of semen, all 139 participants that returned results reported "Negative" results. For the presence of saliva, all 68 participants that returned results reported "Negative" results.

For Item 4, all 327 participants that returned results reported "Positive" for the presence of blood. All of the 141 participants that returned results for semen reported "Negative" results. All of the 67 participants that returned results for saliva reported "Negative" results.

### DNA Analysis Results:

Of the 345 participants that returned results, 317 reported DNA interpretations. Of the twenty-eight participants that did not provide DNA Interpretations, sixteen did not respond, nine stated that the samples were only analyzed for database purposes, and three selected the "No Interpretations" option individually for all Interpretation questions.

For the Item 3 stain, all of the participants that reported interpretations included the victim (Item 1) as a possible contributor. All but one of the participants excluded the suspect (Item 2) as a possible contributor. This participant was inconclusive as to whether the suspect was a contributor to the stain.

For the Item 4 stain, all of the participants that reported interpretations included the victim (Item 1) as a possible contributor and excluded the suspect (Item 2).

A total of 156 participants reported the use of Probabilistic Genotyping (PG) software on either solely the questioned items or all four items. The majority of participants reporting the use of PG software stated in their additional comments that stutter peaks may be included in the DNA results. Of these participants, five reported allelic responses that differed from the consensus/predistribution results for one or more items. The breakdown of inconsistencies is as follows: two reported additional alleles, two reported inconsistent alleles, and one reported inconsistent alleles for one item and additional alleles for another item.

Seven additional participants reported allelic responses that differed from the consensus/predistribution results for one or more items. The breakdown of inconsistencies is as follows: four reported additional alleles, one was missing alleles, and two reported allelic results that differed from the consensus. Based on the interpretations above, these inconsistencies did not appear to affect these participants' conclusions.

## Key for Screening Tests Used

Participants were asked to use, where possible, the following chart of abbreviated screening test names. This was not an all inclusive list and was not designed to determine what tests should be performed. Participants were advised that tests not on this list may be used for screening.

Test	Abbreviation
Acid Phosphatase	AP
Kastle Meyer	KM
Leucomalachite Green	LMG
Microscopic	Micro
Ortho-tolidine	O-tol
Phenolphthalein-Tetramethyl benzidine	PTMB

2DGC3Q	reporting results with stutter filters on
2HGEDL	NR = No Results. There was concordance at DYS391 for both the Globalfiler and Yfiler kits.
2N629R	The results reported for Items 3 and 4 were generated using probabilistic genotyping. All alleles deemed possible for any contributor are being reported. With probabilistic genotyping stutter alleles are considered as either allelic or stutter during the deconvolution of samples. This sometimes results in stutter peaks being reported as allelic. Per laboratory protocol the Y-STR markers (DYS391, DYS570 and DYS576) are not used for interpretation other than to determine if at least one male contributor is present. Therefore, for these loci all peaks above the analytical threshold, stutter or allelic, will be reported. Also when needed: Laboratory policy allows for analyst discretion, based upon training and experience, in the selection of screening tests being performed.
2V233Q	reporting results with stutter filters on
33ZPR6	Not examined for semen given case circumstances.
3FPUPT	Only screening was performed on this test, no DNA.
3M233N	For items interpreted with STRmix, the Globalfiler STR results include all possible alleles for all interpreted genotypes. This may incorporate stutter peaks that would have been filtered during conventional analysis.
3TPM74	Item 3 - can be explained by mix of largely DNA from the victim and an unknown male (not the suspect). Contamination checks carried out; no indication that the male DNA is a contaminant. No indication of DNA from the suspect in the result. In my opinion, this finding can be explained if at least some of the blood tested originated from the victim. Item 4 - profile obtained can be attributed to the blood tested; as matches the victim then the findings can be explained if the blood tested originated from her.
449A6W	The laboratory does not provide an allele table in the report; therefore, this procedure is used only for reporting the results of proficiency tests. The results listed in the CTS report for the evidence samples reflect alleles that were used for reporting. Therefore, some expected alleles may not be listed, particularly those that are in the stutter position. Genotypes are listed for reference samples, and alleles present are listed for evidence samples.
49ZNFZ	reporting with stutter filters on
4CNXXD	I was only required to complete the serology portion of this test. The scenario did not warrant testing for the possibility of semen, and the [Laboratory] does not test for the presence of saliva.
4LT6DD	NR = No results
4W9VFP	The results reported for Items 3 and 4 were generated using probabilistic genotyping. All alleles deemed possible for any contributor are being reported. With probabilistic genotyping stutter alleles are considered as either allelic or stutter during the deconvolution of samples. This sometimes results in stutter peaks being reported as allelic. Per laboratory protocol the Y-STR markers (DYS391, DYS570 and DYS576) are not used for interpretation other than to determine if at least one male contributor is present. Therefore, for these loci all peaks above the analytical threshold, stutter or allelic, will be reported. Laboratory policy allows for analyst discretion, based upon training and experience, in the selection of screening tests being performed.
63AJCM	Samples were analyzed and interpreted per Missing Persons casework protocols which do not allow interpretation of mixtures. The autosomal profile from Item 3 was a mixture and therefore no conclusion regarding the female victim could be made. The Y profile from Item 3 appeared to be single source and therefore could be used to exclude the male suspect. Globalfiler & Minifiler results were concordant for Items 3 and 4.
63U8UH	Qualified Forensic Biologists performed KM, RSID Blood and NaOH Y Screen tests. The DNA analyst performed KM testing and reviewed/interpreted the male screen results. NR = No Results. GlobalFiler and Yfiler Plus DYS391 results concordant.

6ANL73	Elevated stutter (N+/- 4) on Item 3 (suspect's shirt) at D16S539; 13 allele removed.
6GQLRQ	The results reported for Items 3 and 4 were generated using probabilistic genotyping. All alleles deemed possible for any contributor are being reported. With probabilistic genotyping stutter alleles are considered as either allelic or stutter during the deconvolution of samples. This sometimes results in stutter peaks being reported as allelic. Per laboratory protocol the Y-STR markers (DYS391, DYS570 and DYS576) are not used for interpretation other than to determine if at least one male contributor is present. Laboratory policy allows for analyst discretion, based upon training and experience, in the selection of screening tests being performed.
6QG3MM	Biology Screening performed by [Name], 4740. The amylase diffusion test is a presumptive test for the presence of amylase (an enzyme found in body fluids, including saliva).
6R9D73	For item 1 - no YSTR analysis was performed. For item 4 - YSTR analysis was performed, however, no YSTR results were obtained (therefore left blank).
7VLD3U	Extraction: Item 3 and Item 4 were extracted using Chelex Extraction. Quantification: Item 3 and Item 4 were quantified using the Quantifiler Human DNA quantitation kit and carried out by 7500 Real-Time PCR. Amplification: Item 1 and Item 2 were amplified using AMPFISTR Identifiler Direct Kit on 9700 GeneAmp PCR System. Item 3 and Item 4 were amplified using AMPFISTR Identifiler Plus Kit on 9700 GeneAmp PCR System. Item 2 and Item 3 were amplified using AMPFLSTR YFiler Kit on 9700 GeneAmp PCR System. Electrophoresis: The electrophoresis process was carried out by Genetic Analyser 3500xl for Item 1 to Item 4. Quality Control: Reagent blank, positive control, and negative control were carried out along with the analysis and all gave the intended results.
82T46Z	NR= no result. ^ = indicates an allele is below the stochastic threshold
86AMPU	Items 1 and 4 were indicated to be female at quantitation, but were still amplified using the YFiler Plus amplification kit. No Y-STR DNA typing results were obtained from these samples, as expected.
8JTYTP	The probabilistic genotyping software, STRmix, was used for all DNA interpretation. All potential alleles considered during deconvolution have been reported.
8NLD3R	Items 3 and 4 were PSA tested to determine extraction method. Both items tested negative for PSA and were extracted as non-differential samples. PSA testing is not part of this proficiency.
8QQWCL	The results reported for Items 3 and 4 were generated using probabilistic genotyping. All alleles deemed possible for any contributor are being reported. With probabilistic genotyping stutter alleles are considered as either allelic or stutter during the deconvolution of samples. This sometimes results in stutter peaks being reported as allelic. Per laboratory protocol the Y-STR markers (DYS391, DYS570 and DYS576) are not used for interpretation other than to determine if at least one male contributor is present. Therefore, for these loci all peaks above the analytical threshold, stutter or allelic, will be reported. Laboratory policy allows for analyst discretion, based upon training and experience, in the selection of screening tests being performed.
9AKPWJ	Differential extractions were not performed. Therefore complete lysis of sperm cells for male contributors may not occur. This could result in a partial profile for a minor male component. Stutter filters are established by the laboratory based on validation data and used to filter stutter during examiner analysis. Additionally, the laboratory utilizes a probabilistic genotyping software for data interpretation which models stutter during its probabilistic analysis of the data. Elevated stutter peaks which are above the stutter filters established by the laboratory during the validation may still occur but are handled probabilistically during interpretation by the software. The results for this test contain(s) (an) elevated stutter peak(s) which is/are being reported to the vendor as an additional comment but which has/have been modeled as stutter probabilistically during interpretation at the following locus/loci: sample Item 1, locus D16S539 and allele 15.
9VYL4T	NR = no results
9YGTEE	NR = tested but No Results.
ADA3KQ	NT = NOT TESTED. NR = NO RESULTS. N/A = NOT APPLICABLE

B8NB3P	The laboratory does not provide an allele table in the report; therefore, this procedure is used only for reporting the results of proficiency tests. Probabilistic genotyping software was used to aid in the interpretation and statistical analysis of the DNA profiles generated. The results listed in the CTS report for the evidence samples reflect the possible alleles present that were given a weight of at least 99% of being a true allele. Therefore, some expected alleles may not be listed, particularly those that are in the stutter position. Genotypes are listed for reference samples, and 99% weighted alleles present are listed for evidence samples.

D8ULKD	MiniFiler results consistent with GlobalFiler results.
DCTTEN	This test was for serology purposes only. Exhibit 4: AP test inconclusive due to substrate color
DHHBQE	Differential extractions were not performed. Therefore complete lysis of sperm cells for male contributors may not occur. This could result in a partial profile for a minor male component. Stutter filters are established by the laboratory based on validation data and used to filter stutter during examiner analysis. The results for this test contains a possible elevated stutter peak that has been reproducibly confirmed by re-amplification. This is being reported to the vendor as an additional genetic data during interpretation at the following locus/loci: Item 3 - 17 allele at DYS456.
DJDTRF	The results reported for Items 3 and 4 were generated using probabilistic genotyping. All alleles deemed possible for any contributor are being reported. With probabilistic genotyping stutter alleles are considered as either allelic or stutter during the deconvolution of samples. This sometimes results in stutter peaks being reported as allelic. DLDBHU	In the Item 3 we have got mixture of DNA: Victim (Item 1) and a man- another then Item 2 (Suspect). We used LR mix Studio 2.1.3 Program (likelihood ratio) to know what is probability whether the mixture contains Victim DNA or not. LR=2,0616x10E11. It means that it is extremely strong evidence that the Victim's DNA is in this mixture.
DTYUAB	PowerPlex Y23 sample processing was conducted on the following items: Item 2, Item 3. YSTR analysis and interpretation was not conducted. NID = No Interpretable Data. Y-screening (Casework Direct) conducted on Items 3 and 4. Inclusions and exclusions were conducted by the analyst outside of the STRmix software program. STRmix was used, however, to calculate a likelihood ratio for the following: Item 3: Item 1sU_UU (2 person mixture), Item 4: Item1s_U (1 person) where Item 1s = known blood from female victim where U = unknown

GLPYGC	For the mixture profile obtained from item 3, victim could be included as a possible source. As per our laboratory practice, if a single source profile of the victim could be obtained from another item that was seized from the suspect/the crime scene (e.g. item 4 for this case), no PG would be used to interpret the mixture profile for the presence of DNA originating from the victim.

WebCode	Additional Comments
J2CWWD	The results reported for Items 3 and 4 were generated using probabilistic genotyping. All alleles deemed possible for any contributor are being reported. With probabilistic genotyping stutter alleles are considered as either allelic or stutter during the deconvolution of samples. This sometimes results in stutter peaks being reported as allelic. Per laboratory protocol the Y-STR markers (DYS391, DYS570 and DYS576) are not used for interpretation other than to determine if at least one male contributor is present. Therefore, for these loci all peaks above the analytical threshold, stutter or allelic, will be reported. Laboratory policy allows for analyst discretion, based upon training and experience, in the selection of screening tests being performed.
JKPE8H	The following exhibit was inconclusive for the presence of acid phosphatase due to difficulty in accurately detecting a color change as a result of the substrate color: 4.
JKZHCU	Additional interpretation should be done on Q3a for STRmix analysis.
JY92DA	The results reported for Items 3 and 4 were generated using probabilistic genotyping. All alleles deemed possible for any contributor are being reported. With probabilistic genotyping stutter alleles are considered as either allelic or stutter during the deconvolution of samples. This sometimes results in stutter peaks being reported as allelic. Per laboratory protocol the Y-STR markers (DYS391, DYS570 and DYS576) are not used for interpretation other than to determine if at least one male contributor is present. Therefore, for these loci all peaks above the analytical threshold, stutter or allelic, will be reported.
K4ECMF	The laboratory does not provide an allele table in the report, therefore, this procedure is used only for reporting the results of proficiency tests. Probabilistic genotyping software was used to aid in the interpretation and statistical analysis of the DNA profiles generated. The results listed in the CTS report for the evidence samples reflect the possible alleles present that were given a weight of at least 99% of being a true allele. Therefore, some expected alleles may not be listed, particularly those that are in the stutter position. Genotypes are listed for reference samples, and 99% weighted alleles present are listed for evidence samples.

KHVCDE	Minifiler was also used to amplify item 4. Concordant results were obtained for all loci for GlobalFiler and Minifiler.
KYHPQ7	Differential extractions were not performed. Therefore complete lysis of the sperm cells for male contributors may not occur. This could result in a partial profile for a minor male component.

**Scenario:**

Police are investigating the assault of a female victim. The victim was at home eating dinner with a male friend when her ex-boyfriend arrived and demanded to be let in. After a verbal argument between the victim and the ex-boyfriend, the ex-boyfriend pulled out a knife. The victim's friend was able to fight off the ex-boyfriend but not before he stabbed the victim. Investigators are submitting a stain from the shirt (Item 3) the suspect was wearing and a towel (Item 4) found in the suspect's car. Also collected were known blood samples from the female victim (Item 1) and the male suspect (Item 2). No profile was obtained from the victim's friend.

**Items Submitted (Sample Pack B3):**

- Item 1: Known blood from the female victim
- Item 2: Known blood from the male suspect
- Item 3: Questioned stain from suspect's shirt (yellow)
- Item 4: Questioned stain from towel found in suspect's car (blue)

### Part IV: ADDITIONAL COMMENTS

- Use this section to report comments regarding any part of this test.
- Written conclusions (including statistical information) for DNA analysis are not required.
- Any interpretations based on the results obtained should be indicated in the section above.
- Note: Laboratories submitting their results for accreditation are asked to report any additional information that will assist in the review of their results. This includes an explanation of any deviations from a full completion of the test and/or unique findings such as elevated stutter.

**Please note:** Any additional formatting applied in the free form space below will not transfer to the Summary Report and may cause your information to be illegible. This includes additional spacing and returns that present your responses in lists and tabular formats.

### Probabilistic Genotyping Questions

1: Does your laboratory utilize PG software on known reference samples, questioned single source samples, questioned mixture samples or all three?

2: Does your laboratory policy indicate a maximum number of contributors for which you would utilize PG software? If yes, how many?

3: For optimum use of your PG software, what case information is necessary?
