This report contains the data received from the participants in this test. Since these participants are located in many countries around the world, and it is their option how the samples are to be used (e.g., training exercise, known or blind proficiency testing, research and development of new techniques, etc.), the results compiled in the Summary Report are not intended to be an overview of the quality of work performed in the profession and cannot be interpreted as such. The Summary Comments are included for the benefit of participants to assist with maintaining or enhancing the quality of their results. These comments are not intended to reflect the general state of the art within the profession.

Participant results are reported using a randomly assigned "WebCode". This code maintains participant's anonymity, provides linking of the various report sections, and will change with every report.

## **Manufacturer's Information**

Each sample pack consisted of two known bloodstains on clean, white muslin fabric (Items 1 & 2), and two questioned stains; one on clean pink fabric (Item 3) and one on clean, off-white fabric (Item 4). Participants were requested to analyze these items using their existing protocols.

**SAMPLE PREPARATION:** The stains in Items 1, 2, and 3 were prepared using human whole blood which was either drawn into citric acid preservative bags or EDTA tubes. The stain in Item 4 was a mixture prepared from human whole blood and semen. The semen sample was first thawed and mixed 1:1 with TAE buffer, then mixed 1:1 with the blood. Item 1 (50 µl) was created using blood from a female donor. Item 2 (50 µl) was created using blood collected from a male donor. Item 3 (50 µl) was a 1:1 mixture that was prepared using blood from the female donor used for Item 1 and blood from the male donor used for Item 2. Item 4 (50 µl) was created using a 1:1 mixture of blood from the female donor found in Item 1 and semen from a male donor whose known standard was not provided. Stains from different sources were prepared at separate times and were packaged once they were thoroughly dried. Completed sample sets were stored at -20°C until shipment on January 6, 2020 following receipt of predistribution results.

**SAMPLE SET ASSEMBLY:** For each sample set, all four items (1-4) were packed into separate envelopes and then placed together in a pre-labeled sample pack envelope. The sealed sample pack envelopes were then packaged in pre-labeled heat seal envelopes and sealed. This process was repeated until all of the sample sets were prepared.

**VERIFICATION:** All predistribution laboratories confirmed the manufacturer's expected associations. Consistent allelic results were reported for all STR and YSTR loci.

## **Summary Comments**

The 20-5801 DNA-Mixture test is part of the DNA Sample Specific Series, where participants are advised of the body fluid(s) that made up the questioned stains. The test is designed to allow participants to assess their proficiency in the analysis of dried stains. Participants were supplied with two "known" bloodstains (Items 1 and 2) and two "questioned" stains (Items 3 and 4). Item 1 was created using blood from a female donor. Item 2 was created using blood from a male donor. Item 3 was created using a mixture of blood from the female donor used for Item 1 and blood from the male donor used for Item 2. Item 4 was created using a mixture of blood from the female donor used for Item 1 and semen from a male donor whose standard was not provided. (See Manufacturer's Information for preparation details)

All of the 235 participants that returned results reported DNA interpretations.

For the Item 3 stain, all but one of the participants that reported interpretations included the victim (Item 1) as a possible contributor. This remaining participant excluded the victim as a possible contributor. All participants that reported interpretations included the suspect (Item 2) as a possible contributor to Item 3.

For the Item 4 stain, all participants that reported interpretations included the victim (Item 1) as a possible contributor to Item 4. All but one of the participants that reported interpretations excluded the suspect (Item 2) as a possible contributor to Item 4. This one remaining participant was inconclusive as to whether the suspect was a contributor to the stain.

A total of 42 participants reported the use of Probabilistic Genotyping (PG) software on either solely the questioned items or all four items. Inconsistent results were reported by ten of these participants. The breakdown of inconsistencies is as follows: all but one reported additional alleles for one or more questioned items and two participants were missing alleles. The majority of participants reporting the use of PG software stated in their additional comments that stutter may be included in the DNA results.

Twenty-three additional participants reported allelic responses that differed from the consensus/predistribution results for one or more items. The breakdown of inconsistencies is as follows: 13 reported additional alleles, five were missing alleles, three reported allelic results that differed from the consensus, one reported a combination of different types of inconsistencies and one reported the Item 2 profile for the Item 3 results and the inverse for the Item 2 results. Based on the interpretations above, these inconsistencies did not appear to affect these participants' conclusions.

6BPLPJ	regarding item 4 locus DYS518 an 38 allele appeared next to a real 37 in a +1 stutter position (>5% accepted lab stutter ratio for this locus in our lab). In our lab, such an appearance would normally require additional investigation before deciding how to report this allele. If we were unable to solve the question regarding this locus, we would possibly not include this locus in our report and use it for comparison only.
6NCX2T	Item 4 was extracted using both the Maxwell 16 robot and organic methods. Minor alleles between fractions of Item 4 are consistent with carryover from one fraction to the other. The carryover alleles between fractions slightly differed between extraction methods. Elevated stutter was detected in the following samples: Maxwell and organic extractions of Item 3: elevated stutter in 16.2 position at D19S433; Organic extraction of Item 4, sperm fraction: elevated stutter in 23 position at D12S391.

98VXKL	The minor results reported in the Y-STR portion of Item 4sp are all in stutter positions and could be due to elevated stutter.

DWFTH6	The answers in this CTS report were reported using probabilistic genotyping. All alleles deemed possible for any contributor to the mixture are being reported. With probabilistic genotyping stutter alleles are considered as either allelic or stutter during the deconvolution of samples. This sometimes results in true stutter peaks being reported as possible alleles. In addition, probabilistic genotyping also considers the potential for allele drop-out. Possible missing alleles are reported as "Q" alleles in the results. With regard to the Yfiler Plus amplification of Item 4 (e fraction), at DYS627 there were two DNA types detected. The smaller of the two peaks fell into a stutter position of the taller peak, and could be considered stutter. However, it was slightly above the stutter observed in our kit validation, therefore this peak was considered allelic for this interpretation, as per lab policy, but was not considered as part of the major haplotype.
EE6PXX	Extraction: Item 1, Item 2, Item3 and Item 4 were extracted using chelex method. F43QN3	For Item 4 a differential extraction was used, based on fenol/chloroform/isoamyl buffer (preferential method). In epithelial fraction of item 4m, two person mixture was obtained. In sperm fraction of Item 4 no results were obtained as autosomal DNA genotyping (PowerPlex Fusion 6C) as Y-STR (Y-filer Plus). Conclusion: Item 3: The DNA findings are at least $LR = 1,44 \times 10^{38}$ more probable if hypothesis Hp is true, which says the suspect and victim are the donors of DNA to the sample, compared to its alternative, described by hypothesis Hd, which says that the donors are two different, unknown, unrelated persons from population Item 4: The DNA findings are at least $LR = 1,33 \times 10^{15}$ more probable if hypothesis Hp is true, which says the victim and one different, unknown, unrelated person are the donors of DNA to the sample, compared to its alternative, described by hypothesis Hd, which says that the donors are two different, unknown, unrelated persons from population. Suspect can be excluded from Item 4.
FBCU8C	The answers in this CTS report were reported using probabilistic genotyping. All alleles deemed possible for any contributor to the mixture are being reported. With probabilistic genotyping stutter alleles are considered as either allelic or stutter during the deconvolution of samples. This sometimes results in true stutter peaks being reported as possible alleles. In addition, probabilistic genotyping also considers the potential for allele drop-out. Possible missing alleles are reported as "Q" alleles in the results.
FW6364	The Item 4 epithelial fraction indicated 3 contributors at the FGA locus including a peak (23) above our detection level but below our reporting level. The suspect (Item 2) would be reported in our laboratory as: It is estimated that the mixed DNA profile obtained is approximately 150 times more likely to have occurred if he has not contributed DNA, rather than if he has.
FXW2DA	NR = No results. Item 1 not analyzed for Y-STR (known sample from female).

Item 2, Item 3 and Item 4 were amplified using AMPFLSTR YFiler Kit on 9700 GeneAmp PCR System. Electrophoresis: The electrophoresis process was carried out by Genetic Analyser 3500xl for Item 1 to Item 4. Quality Control: Reagent blank, positive control, and negative control were carried out along with the analysis and all gave the intended results.

NPBWR2	Markers with empty boxes indicate that no experiment was performed. Markers filled with a single dash "-" indicate that no allele resulted. The likely minor alleles in item "4 e" were enclosed within brackets "[]". The Mixture Interpretation Threshold used for analysis was 175 RFU. The DNA profile detected in "item 3" appears to be a mixture of at least two contributors; both the victim "item 1" and the suspect "item 2" cannot be excluded as contributors in the DNA evidence detected in this sample. A trace of the DNA profile of the epithelial cells fraction was present in "item 4 sp". The DNA profile was deduced from "item 4 sp" after taking into consideration the contribution of the known victim. This DNA profile detected in the sperm cell fraction of "item 4", came from an unknown male.
PCTBC2	NR = no results. Y-STR testing was not performed on the female victim known sample (item 1).
PG4GUU	Item 1: A female DNA profile was obtained from the reference sample relating to the female victim. Item 2: A male DNA profile was obtained from the reference sample relating to the male suspect. Item 3: Blood was detected. A mixed DNA profile from at least two contributors was obtained. Female victim cannot be excluded as a contributor to this profile. Male suspect cannot be excluded as a contributor to this profile. Item 4: Blood was detected. Semen was detected. Sperm fraction: A mixed DNA profile from at least two contributors was obtained. One contributor, referred to as Male 1, was obtained from this profile. The remainder of the profile is not suitable for identification purposes. The second contributor consists only of 1 allele (23 in FGA) of a low peak height (333 RFU, where our threshold is 225 RFU). Female victim is excluded as a contributor to this profile. Male suspect is excluded as a contributor to this profile. Epithelial fraction: A mixed DNA profile from at least two contributors was obtained. Female victim cannot be excluded as a contributor to this profile. Male 1 cannot be excluded as a contributor to this profile. Male suspect is excluded as a contributor to this profile. This is an interim report only. A statement can be issued upon request.

V66PJW	We performed statistical analysis of results using "LRMix studio v.2.1.3 -Community Edition" (H.Henced, P.Gill, 2016)as we do with normal results. Value of LR was interpreted in respect of value of the proof and was express in words, using the ENFSI recommendation (ENFSI guideline for evaluative reporting in forensic science, 2015). LR value was count only for Item 3 stain, because we had confirmed comparative material from the victim (Item 1) and the suspect (Item 2)to proceed with analysis. Calculations was based on population database for GlobalFiler PCR Amplification Kit producer of reagents for Caucasian population. We used allele frequencies from that database. This statistical analysis contain two conclusions: 1)Proof from genetic analysis for Item 3 stain give extreme high support ( $LR=2,81 \times 10$ to the power of 14)for hypothesis, that this sample contain DNA of the victim (Item 1) and different DNA belong to unknown (NN), not-related person, against to alternative hypothesis saying that Item 3 stain contain DNA of two different, unknown (NN), not-related persons. (Item 1 + NN : NN + NN, $LR=2,81 \times 10$ to the power of 14, dropout probability 0,12). 2)Proof from genetic analysis for Item 3 stain give extreme high support ( $LR=9,86 \times 10$ to the power of 11)for hypothesis, that this sample contain DNA of the suspect(Item 2) and different DNA belong to unknown (NN), not-related person, against to alternative hypothesis saying that Item 3 stain contain DNA of two different, unknown (NN), not-related persons. **Scenario:**

Police are investigating the sexual assault of a female victim. The victim's claim is that while attending a friend's party she had a few drinks and started to feel dizzy. The victim then went into a bedroom to lay down. When she woke up in the morning, she was completely naked. She vaguely remembers fighting off her friend and another man. Police identified her friend as a suspect but were unable to identify the other man. Investigators are submitting a stain from a shirt (Item 3) the suspect was wearing and a stain from the underwear (Item 4) the victim was wearing. Screening has been performed on both samples with the following results: Item 3 (suspect's shirt) is positive for blood, and Item 4 (victim's underwear) is positive for blood and semen. Also collected were known blood samples from the female victim (Item 1) and the male suspect (Item 2).

**Items Submitted (Sample Pack S1):**

Item 1: Known blood from the female victim

Item 2: Known blood from the male suspect

Item 3: Questioned blood stain from suspect's shirt (pink)

Item 4: Questioned blood and semen mixture from victim's underwear (off-white)
