Blood Alcohol Analysis

Test No. 25-5641 Summary Report

Each participant received a sample pack containing four vials of blood with differing concentrations of ethanol; they were asked to determine the blood alcohol concentration of each item. Data were returned from 268 participants and are compiled into the following tables:

This report contains the data received from the participants in this test. Since these participants are located in many countries around the world, and it is their option how the samples are to be used (e.g., training exercise, known or blind proficiency testing, research and development of new techniques, etc.), the results compiled in the Summary Report are not intended to be an overview of the quality of work performed in the profession and cannot be interpreted as such. The Summary Comments are included for the benefit of participants to assist with maintaining or enhancing the quality of their results. These comments are not intended to reflect the general state of the art within the profession.

Participant results are reported using a randomly assigned "WebCode". This code maintains participant's anonymity, provides linking of the various report sections, and will change with every report.

Manufacturer's Information

Each sample pack consisted of four vials of blood, each with a different blood alcohol concentration (BAC). Participants were asked to analyze the contents of each vial and report the blood alcohol concentration.

SAMPLE PREPARATION: A stock solution of 10% ethanol in water was used to spike each item. The stock solution was prepared by combining absolute ethanol with distilled water and stored appropriately to prevent evaporation.

ITEM PREPARATION: A predetermined amount of ethanol stock solution and the equivalent of 1% w/v sodium fluoride was added to pooled human whole blood. Mixing continuously to ensure homogeneity, a volume of 5 mL of the mixture was pipetted into each of the pre-labeled vials, which contained 12 mg potassium oxalate and 15 mg sodium fluoride (this NaF was included in the 1% w/v NaF calculation). The vials were sealed and inverted to mix the chemicals in the vials with the blood solution. All vials were placed in a refrigerator immediately after production and remained there until the sample packs were prepared.

VERIFICATION: Predistribution results were consistent with each other and the manufacturer's preparation information.

SAMPLE PACK ASSEMBLY: Once verification was completed, all items were placed into Department of Transportation regulated shipping containers and the sample packs were returned to the refrigerator until shipment.

Item	Preparation BAC (g/100 mL)
1	0.11
2	0.30
3	0.08
4	0.16

Please note that the Preparation BAC is the value used for calculations during the test preparation phase and may not necessarily represent the final concentration of the samples. It is advised to view the Grand Mean statistics available in this Summary Report as well as wait for the Individual Reports before evaluating performance.

Summary Comments

This test was designed to allow participants to assess their proficiency in the quantitative analysis of ethanol in human blood. Participants were supplied with four vials with differing blood alcohol concentrations (BAC). Items 1, 2, 3, and 4 were manufactured with BAC values of 0.11, 0.30, 0.08, and 0.16, respectively. Refer to the Manufacturer's Information for preparation details.

Table 1: Reported Results shows the BAC and uncertainty that each participant would report according to their normal reporting procedures (e.g. mean, lowest result, truncated average). Table 3: Raw Data shows the results in specified units (g/100 mL) from each determination made by the laboratory to produce their reported result. The raw data was used to calculate the grand mean and the standard deviation for each item. The grand mean and standard deviation are supplied to assist the participants and accrediting bodies in determining the acceptability of the results. Participants with extreme data (± 5 STD from grand mean) have been marked with an "X" and their results were excluded from the calculations of the grand mean and standard deviation.

Of the 268 responding participants, eight participants reported extreme data for one or more items. Within this group of eight, three participants reported extreme values for all four items. A breakdown of the number of participants reporting extreme data per item is as follows: five for Item 1, five for Item 2, five for Item 3, and six for Item 4.

The majority of the population used the mean of duplicate/several determinations for their reporting procedures. The most utilized method of analysis among participants was Headspace GC/FID.

Reported Results

What is the blood alcohol concentration of the sample in each of the vials?

Additional Comments

TABLE 5

WebCode	Additional Comments
29E2A8	Date Completed 04/03/2025
3DJ8HH	Laboratory does not presently incorporate uncertainty measurement in reporting
4C9HY7	Item 2: Reported result is outside of current calibration. The calibration curve is linear from 0.020 g/100 mL to 0.300 g/100 mL. No measurement of uncertainty is included for results outside of the calibrated range.
4UNUMQ	Uncertainty of measurement (5% at 99.7% confidence interval) is calculated from the mean of several determinations, rounded up (to 3 decimal places), and is reported in the same units as the results. Sample tubes were not completely filled - headspace over samples may contribute to some loss of volatile. Additionally, tubes were re-opened and re-sampled due to original run not meeting quality control parameters. Ethyl Alcohol indicated with values of less than 0.020g/100cc, but greater than 0.000g/100cc, are reported out as "below reportable limit".
64N48K	GC#9 The blood alcohol concentration reported in 1a [Table 1: Reported Results]. above represents a truncated average value of duplicate analyses measuring e.g. 0.105% and 0.107%. The average value of the duplicate analyses with its expanded uncertainty is e.g. 0.106% +/- 0.005%. The expanded uncertainty is reported at a 99% confidence level.
6M4D9L	Our UM is +/-5.5% or +/-0.004AC which ever range is greater. This is at a k=3. Our result is the mean of the 4 data points truncated to three decimal places.
7PMRCL	Raw data section 2 [Table 3] only allows 4 decimal places for non-zero numbers. Truncated for 5th decimal non-zero numbers.
87QJV3	According to [State Statute] "For blood tests for alcohol content, the accepted scientific uncertainty in measurement is plus or minus 0.005 g/100mL or 10 percent of the average measurements, whichever is greater."
89CB2D	The samples were in non-[Organization] containers.
9EXMDL	samples are run in duplicate. lower result is reported. Duplicate replicate results must be within 2.5% of the lower value.
9N3UTK	Raw data collected to five decimal places as follows: item 1 - 0.11193 and 0.10967; item 2 - 0.30556 and 0.30124; item 3 - 0.08494 and 0.08477; and item 4 - 0.16323 and 0.16328.
9WJ2X6	ULOQ is 0.300 gram%
B2NNJ6	The final report values on the report are truncated, two digit mean and the three digit mean +/- UOM follow. Item #1 - 0.10; Item #2 - 0.30; Item #3 - 0.08; Item #4 - 0.15.
CARDGZ	ULOQ is 0.300 gram%
DDPWGD	GC #10 The blood alcohol concentration reported in 1a [Table 1: Reported Results]. above represents a truncated average value of duplicate analyses measuring e.g., 0.108% and 0.109%. The average value of the duplicate analyses with its expanded uncertainty is e.g., 0.108% +/- 0.005%. The expanded uncertainty is reported at a 99% confidence level.
E277Q8	During the analysis, we used Agilent technologies model: 7890B GC/7697A Headspace sampler with two columns namely: (1)DB-ALC1:(Agilent Technologies 123-9134) 20 oC-260 oC (280 oC):30m * 320microm * 1.8microm. (2)DB-ALC2: (Agilent Technologies 123-9234) 20 oC-260 oC(280 oC), 30m * 320microm * 1.2microm.
EZFXMX	The upper limit of quantitation (ULOQ) for ethanol is 0.300 gram%. Results greater than the ULOQ are reported as "greater than 0.300 gram% ethyl alcohol in whole blood."

TABLE 5

WebCode	Additional Comments
F736MG	Analysis Summary and Reporting Limits: Analysis by gas chromatography with flame ionization detection, a method approved by the Commissioner of Public Safety, in whole blood for: Analyte Quantitative Range (g/100 mL) Ethanol 0.010 – 0.400 Measurement uncertainty is reported at a 99.73% level of confidence for all blood ethanol analyses. All reported results are average values.
HKVJVA	Raw data section 2 [Table 3] only allows 4 decimal places for non-zero numbers. Truncated for 5th decimal non-zero numbers.
HLMHA9	LOD is 0.005 g/100 mL. LOQ is 0.020 g/100 mL. Measurement of uncertainty is +/- 5% of the quantitative value. Acetaldehyde detected in items 1-4.
KKZVLA	Internal standard: n-propanol LOD of the method: 3 mg of ethanol/100 mL of blood LOQ of the method: 15 mg of ethanol/100 mL of blood
KY8JYD	Note that our laboratory's policy is that we do not report uncertainty of measurement on our final reports, which is why it was not reported for this survey. However, our uncertainty of measurement is included for each sample in its corresponding case file/discovery packet, which includes all raw data.
KZFTQB	Instrument was a Headspace GC/FID with dual column/dual FID. The internal standard was n-propanol.
L8EXZ7	Raw data section 2 [Table 3] only allows 4 decimal places for non-zero numbers. Truncated for 5th decimal non-zero numbers.
LB8YZY	Uncertainty of measurement (5% at the 99.7% confidence interval) is calculated from the mean of several determinations, rounded up (to three decimal places), and is reported in the same units as results. Sample tubes were not completely filled - headspace over the samples may contribute to some loss of volatiles.
LPTE3Y	Este Laboratorio no reporta incertidumbre ya que en el [State] no existe un límite legal establecido. [CTS Translation: This Laboratory does not report uncertainty since there is no established legal limit in the State.]
LZAYMV	The final reported values on the report are truncated, two digit mean and then the three digit mean +/- UOM follow. Item#1-0.10; Item#2-0.29; Item#3-0.08; Item#4-0.16
MDWLCM	The accepted scientific uncertainty for blood and breath tests for alcohol is specified in the [State Statute]: For blood tests for alcohol content, the accepted scientific uncertainty in measurement is plus or minus 0.005 g/100 mL or 10 percent of the average of measurements, whichever is greater.
MUJ433	uncertainty of measurement at k=3 is +/- 5.5% of the mean nominal value or 0.004, whichever is greater.
NE8PL6	Raw data section 2 [Table 3] only allows 4 decimal places for non-zero numbers. Truncated for 5th decimal non-zero numbers.
NH72G6	Raw data section 2 [Table 3] only allows for 4 decimal places for non-zero numbers. Results for this section were truncated if the 5th decimal place was a non-zero number.
NKA2BA	The laboratory procedure involves removing 6% from the measured average alcohol concentration before being reported to the customer. Item 4 was subject to a 5-fold dilution (with water) prior to analysis due to the undiluted sample not sampling correctly on the autosampler. The above concentrations take the dilution factor into account.
NNXBQ4	The uncertainty of measurement associated with each result is 5.5% or 0.004, whichever is greater, and corresponds to a 99.7% level of confidence.
NWL7NX	The truncated mean of several determinations +/- the uncertainty of measurement. Results are reported out and truncated to three significant figures from the original data. Uncertainty of measurement is calculated at +/- 5% of the original data and rounded up to the same significant figures as the reported data. The tubes were not completely filled - Headspace over the samples may contribute to some loss of volatiles.

TABLE 5

WebCode	Additional Comments
P3MXAZ	Samples were analyzed on GC#9. The blood alcohol concentration reported in 1a [Table 1: Reported Results] represents a truncated average value of duplicate analyses measuring for example 0.107% and 0.107%. The average value of the duplicate analyses with its expanded uncertainty is 0.107% +/- 0.005%. The expanded uncertainty is reported at a 99% confidence level.
P4HKM4	Item 1 (CTS 25-5641A): Traces of apparent acetaldehyde detected. Item 2 (CTS 25-5641B): Traces of apparent acetaldehyde detected. Item 3 (CTS 25-5641C): Traces of apparent acetaldehyde detected. Item 4 (CTS 25-5641D): Traces of apparent acetaldehyde detected.
PE4KN8	Item 2: Acetaldehyde observed
Q6QTU4	Uncertainty of measurement (5% at the 99.7% confidence interval) is calculated from the mean of several determinations, rounded up (to 3 decimal places), and reported in the same units as results. Sample tubes not completely filled - headspace over samples may contribute to some loss of volatiles.
Q9VJXX	Item 3 was not tested.
QKJPP8	GC-FID
UNEBDL	Item 2 outside of calibration**. **The reported result of Item 2 is outside of current calibration. The calibration curve is linear from 0.020 g/100mL to 0.300 g/100mL. No Measurement of Uncertainty is included results outside of the calibration range.
W7CNP	El análisis se realizó por triplicado de cada una de las muestras por elemento. [CTS Translation: The analysis was performed in triplicate of each of the samples per element.]
XEX32U	Raw data section 2 [Table 3] only allows 4 decimal places for non-zero numbers. Truncated for 5th decimal non-zero numbers.
Y92VWQ	Samples were analyzed on GC #9. The Blood Alcohol concentration reported in 1a [Table 1: Reported Results] represents a truncated average value of duplicate analyses measuring for example 0.109% and 0.105%. The average value of the duplicate analyses with its expanded uncertainty is 0.107% +/- 0.005%. The expanded uncertainty is reported at a 99% confidence level.
YHCXGR	GC #9 The blood alcohol concentration reported above represents a truncated average value of duplicate analysis measuring e.g. 0.106% and 0.107%. The average value of the duplicate analysis with its expanded uncertainty is e.g. 0.106% +/- 0.005%. The expanded uncertainty is reported at a 99% confidence level.
YPP4VA	According to protocol, any result over 0.300 g/100mL will not have a measurement uncertainty listed on the report.

Test Description:

Investigators have submitted four tubes of blood from separate cases to be examined; each was taken from a person suspected of driving under the influence of alcohol. Using your laboratory's procedures, analyze each tube and report the blood alcohol concentration.

Please disregard the tube's labeling with regard to NaF; additional NaF was added to achieve a 1% w/v concentration in the blood.

Items Submitted (Sample Pack BAC1):

Items 1-4: Vials of Blood

1a.) What is the blood alcohol concentration of the sample in each of the items? (Results should be reported using your laboratory reporting criteria for decimal places, uncertainty determinations, and units.)

	Uncertainty (k=)	Units
